# WATER CATCHMENT

## Water Catchment

is an area where water is collected by the natural landscape and then runs down a river to the ocean. We collect and use it from the river.

## Why is Solomon Water so concerned about this catchment areas?

Solomon Water aims to supply water of good quality. Protection of the water supply catchment is essential in guaranteeing the supply of good quality and safe water. An unprotected water supply catchment could lead to contamination of water supply from:

### Chemicals

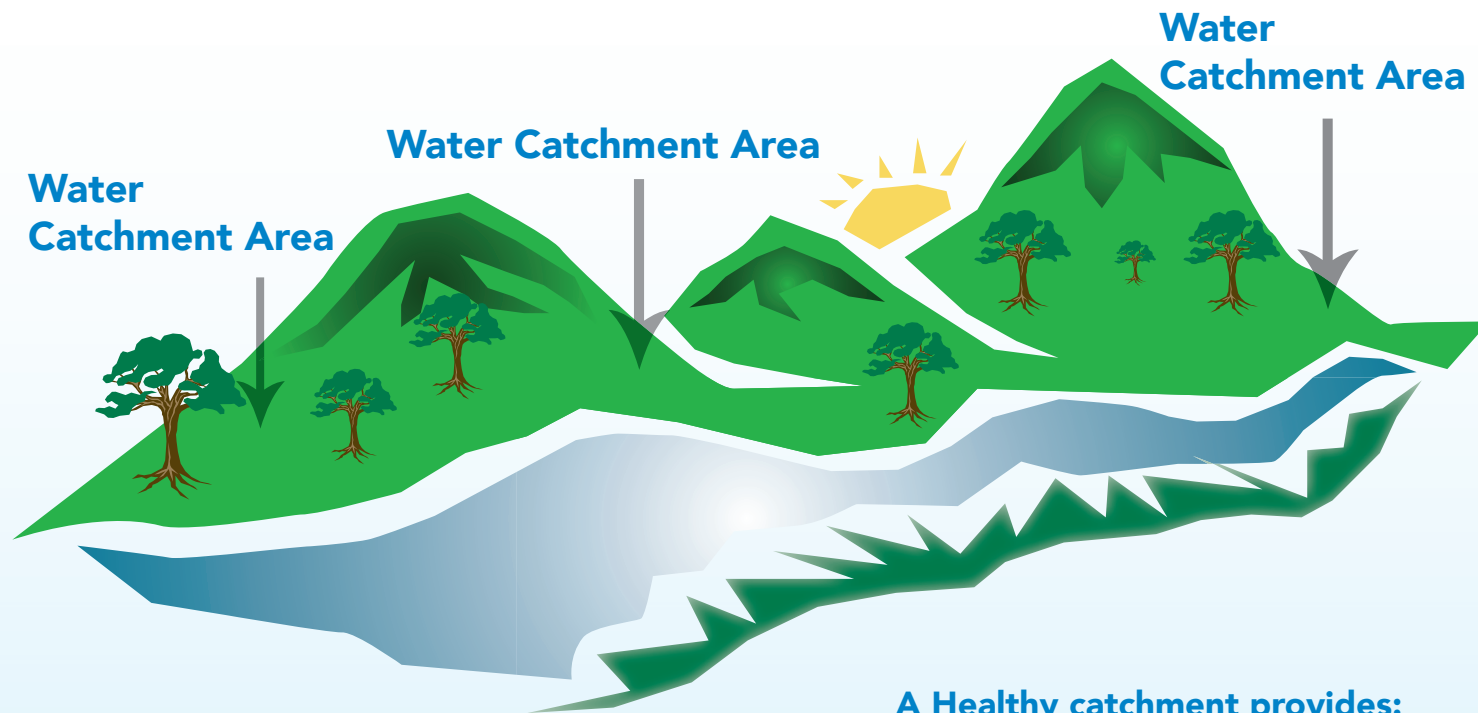

Fertilizers, Pesticides and Insecticides

### Things that make you sick that are generally from human habitation

**Bacteria** - *E.coli*, *S.typhi* and *V.cholerea*

**Viruses** - Rota Viruses, Enteroviruses

**Parasites** - Tapeworm, Helminths

All these could have serious health consequences

## What can you do to help

- Do not cut trees in the catchment area
- No gardening where pesticides and fertilizers are used
- Do not build houses near water sources
- No cattle or poultry farm and pig pen in catchment area

## A Healthy catchment provides:

- A source of clean drinking water
- Unspoiled natural areas for recreation
- Habitat for plants and animals
- Healthy vegetation
- Reliable and clean water for farming
- Resources are available for now and future
